**CLOUD COMPUTING USING AMAZON WEB SERVICES**

**IV Semester**

*Submitted in partial fulfillment of the requirements for the award of degree of*

Master of Computer Applications

By

**INDRAJEET KUMAR**  
**USN: 1RX16MCA21**

Under the Guidance of

**Raghu Prasad K**  
Assistant Professor

**Department of Master of Computer Applications**

**RNS Institute of Technology**

Dr. Vishnuvardhan Road, Rajarajeshwari Nagar Post, Channasandra Bangalore - 560 098.  
**2017-2018**

# **RNS INSTITUTE OF TECHNOLOGY**

Dr. Vishnuvardhan Road, Rajarajeshwari Nagar Post, ChannasandraBangalore-560 098.

## **DEPARTMENT OF MASTER OF COMPUTER APPLICATIONS**

### **CERTIFICATE**

This is to certify that **INDRAJEET KUMAR** of 4<sup>th</sup> Semester MCA, bearing the USN: **1RX16MCA21** has completed his 4<sup>th</sup> Semester seminar topic entitled **Cloud Computing Using Amazon Web Services** as a partial fulfillment for the award of the degree of Master of Computer Applications, during the year 2018, under our supervision.

**Raghu Prasad K**  
Seminar Guide  
Assistant Professor

**Dr. N P Kavya**  
Professor and Head  
Dept. of MCA

## DECLARATION

I hereby declare that the seminar topic entitled, “**Cloud Computing Using Amazon Web Services**” was carried out and written by me us under the guidance of **Mr. Raghu Prasad K**, Assistant Professor, Department of Master of Computer Applications, RNSIT, Bangalore. This work has not been previously formed the basis for the award of any degree or certificate nor has been submitted elsewhere for the award of any degree.

INDRAJEET KUMAR  
(1RX16MCA21)

## ACKNOWLEDGEMENT

The Satisfaction and the euphoria that accompany the successful completion of any task would be incomplete without the mention of the people who made it possible, whose constant guidance and encouragement crowned my efforts with success.

I take this opportunity to acknowledge the help I have received from different individuals and place on record my appreciation and thanks to those who helped in bringing it out in this seminar.

I express my sincere words of gratitude to our Chairman **Dr. R N Shetty**, for creating an academic environment to lighten our career.

I express my heartfelt words of gratitude to our beloved Director **Dr. H N Shivashankar** and our honorable Principal **Dr. M K Venkatesha** for providing an academic environment to achieve academic excellence.

I would like to express my honest words of gratitude to **Dr. N P Kavya**, Head of the Department of MCA, RNSIT, for providing academic environment which nurtured my practical skills contributing to the success of this seminar.

I express my heartfelt thanks to my Seminar Coordinators **Mr. Raghu Prasad K**, Assistant Professor, Dept. of MCA, RNSIT for their constant guidance, devoted support.

I also express my heartfelt thanks to my **Family, Friends** and **Well Wishers**.

INDRAJEET KUMAR  
(1RX16MCA21)

## **ABSTRACT**

Cloud computing provides with dynamically scalable infrastructure and virtualized resources that allow application to meet infinite demands, with cheap and reliable services to customers and assuring them with QoS inspite of unpredictable consumer behavior.

In this paper we present Overview of Cloud Computing , History, Basic Need for Cloud Computing Emergence, Services provided by cloud computing, some case studies of Amazon.com, Google app engine and salesforce.com, recent advances and future scope of cloud computing, Cloud-Scale Repository Design, Problems Related With Cloud Computing.

## CHAPTER 1

### INTRODUCTION

#### 1.1 OVERVIEW

Cloud Computing emerges as a hot topic from 2007 due to its ability of offering dynamic IT infrastructures, QoS guaranteed computing environments and configurable platform services.

With web 2.0 has potential to change the face of entire computing industry and may signal of return to age of centralization with data application and processing powers with user having online utility interface. Amazon, Google, IBM are with cloud computing revolution.

Loosely speaking, cloud computing is a style of computing paradigm in which typically real-time scalable resources such as files, data, programs, hardware, and third party services can be accessible from a Web browser via the Internet to users (or called customers alternatively). These users generate service requests at a given rate to be processed at the service center hosted by the service provider through the cloud. according to QoS requirements and for a given fee.

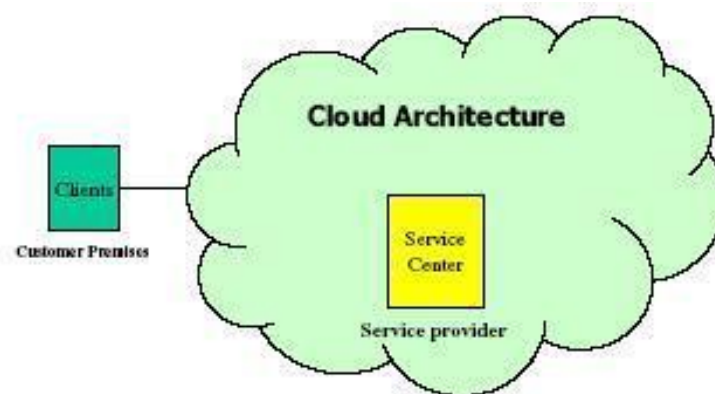

Figure 1: A Computer Service Scenario in Cloud Computing

#### 1.2 HISTORY

At around in 1961, John MacCharty suggested in a speech at MIT that computing can be sold like a utility, just like a water or electricity. It was a brilliant idea, but like all brilliant ideas, it was ahead of its time, as for the next few decades, despite interest in the model, the technology simply was not ready for it.

But of course time has passed and the technology caught that idea and after few years we mentioned that:

- In 1999, Salesforce.com started delivering of applications to users using a simple website. The applications were delivered to enterprises over the Internet, and this way the dream of computing sold as utility were true.
- In 2002, Amazon started Amazon Web Services, providing services like storage, computation and even human intelligence. However, only starting with the launch of the Elastic Compute Cloud in 2006 a truly commercial service open to everybody existed.
- In 2009, Google Apps also started to provide cloud computing enterprise applications.
- In 2009, Microsoft launched Windows Azure, and companies like Oracle and HP have all joined the game. This proves that today, cloud computing has become mainstream.

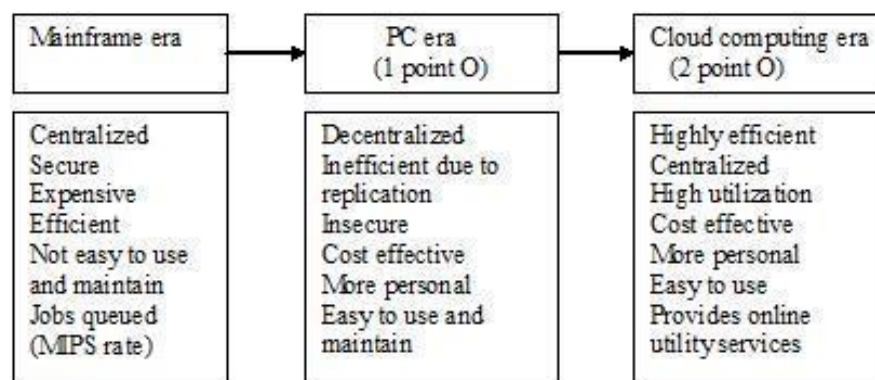

Figure 2: Comparative Study from Traditional System

### 1.3 BASIC NEED FOR CLOUD COMPUTING EMERGENCE

High demand to grow ,to scale, to meet increasing customer demand this lead to move from single web server database mode to service oriented massively scalable distributed system in voice of Jinesh Varia Evangelist of Amazon.com.

## **1.4 NECESSITY**

Assume that you are an executive at a very big corporation. Your particular Responsibilities include to make sure that all of your employees have the right hardware and software they need to do their jobs. To buy computers for everyone is not enough. You also have to purchase software as well as software licenses and then provide these software's to your employees as they require. Whenever you hire a new employee, you need to buy more software or make sure your current software license allows another user. It is so stressful that you have to spend lots of money.

But, there may be an alternative for executives like you. So, instead of installing a suite of software for each computer, you just need to load one application. That application will allow the employees to log-in into a Web-based service which hosts all the programs for

the user that is required for his/her job. Remote servers owned by another company and that will run everything from e-mail to word processing to complex data analysis programs. It is called cloud computing, and it could change the entire computer industry.

## CHAPTER 2

### IMPLEMENTATION

#### 2.1 CLOUD COMPUTING FUNCTIONALITY

##### i. Software as a Service

Software or application is hosted as a service and provided to customers across the Internet. This mode eliminates the need to install and run the application on the customer's local computer. SaaS therefore alleviates the customer's burden of software maintenance, and reduce the expense of software purchases by on demand pricing.

Existing commercial SaaS offerings include horizontal business services such as CRM (E.g. Salesforce.com) and larger organizations such as Amazon<sup>21</sup> and Microsoft<sup>22</sup>.

##### ii. Hardware as a Service

HaaS: Hardware as a Service Hardware as a Service was coined possibly at 2006. As the result of rapid advances in hardware virtualization, IT automation, and usage metering and pricing, users could buy IT hardware - or even an entire data center/computer center - as a pay-as-you-go subscription service. The HaaS could be flexible, scalable and manageable to meet your needs.

##### iii. Data as a Service

Data in various formats, from various sources, could be accessed via services to users on the network. Users could, for example, manipulate remote data just like operate on local disk; or access data in a semantic way on the Internet.

##### iv. Platform as a Service

From the consumer's viewpoint, PaaS software probably resembles SaaS, but instead of software developers building the program to run on their own Web infrastructure, they build it to run on someone else's. For example, Google offers Google App Engine, a service that lets development organizations write programs to run specifically on Google's infrastructure.

Figure 3: Cloud Functionalities

#### v. Infrastructure as a Service

Similar to PaaS, IaaS lets the development organization define its own software environment. This basically delivers virtual machine images to the IaaS provider, instead of programs, and the machines can contain whatever the developers want. The provider can automatically grow or shrink the number of virtual machines running at any given time so that programs can more easily scale to high workloads, saving money when resources aren't needed.

## 2.2 SIMPLE CASE STUDY

Whether your business is moving everything to the cloud, or struggles to give employees access to critical information, or just wants an affordable email solution, Google Apps can help you stretch resources and work smarter. Google Apps offers simple, powerful communication, and collaboration tools for enterprises of any size in business, education, or government—all hosted by Google to streamline setup, minimize maintenance, and reduce IT costs.

Google-powered e-mail, IM, and calendaring help users stay connected and work together effectively. The essential collaboration tools—Google Docs, Google Video, and Google Sites—boost productivity and encourage innovation. Google Apps has multiple layers of protection to keep your business data safe and secure. Google operates one of the largest networks of distributed data centers in the world, and the company goes to great lengths to protect the data and intellectual property on these servers. Each piece of content can be as private or as public as necessary.

Google Apps includes a 99.9% uptime guarantee. Phone support is available for critical issues. Google strives to make Google Apps as open as possible, with full accessibility and an ever-growing library of plug-ins. In addition, the Google Apps engine provides an infrastructure for people to do their own applications development within the Google Apps architecture.

Figure 4: Cloud Computing in Google Trends

As reported in Google trends (Figure 4), Cloud computing (blue line), which is enabled by Virtualization technology (yellow line), has outpaced Grid computing [7] (red line).

## 2.3 AMAZON CLOUD COMPUTING

Amazon Elastic Compute Cloud (Amazon EC2) is a web service that provides resizable computing capacity in the cloud. It is designed to make web-scale computing easier for developers. Amazon provides following cloud computing based services:

### Amazon Elastic Compute Cloud (Amazon EC2)

- Amazon SimpleDB
- Amazon Simple Storage Service (Amazon S3)
- Amazon CloudFront
- Amazon Simple Queue Service (Amazon SQS)
- Amazon Elastic MapReduce
- Amazon Relational Database Service

Amazon provides IaaS services through its elastic cloud computing (Amazon EC2). These account holders receive public-key credentials for connecting to the servers and managing their applications, particularly virtual machine examples that run as the client's user. Unfortunately, Amazon currently lets a user have only one set of credentials per

account. This makes it difficult to run applications in multiple pieces, with each piece administered separately either by business function or geography.

## **2.4 SALESFORCE CLOUD**

Salesforce.com is the enterprise cloud computing company. Features provided by salesforce in field of cloud computing:

Customers are Building and Deploying PaaS Apps in the Cloud Revolutionary Utility Pricing for Force.com Platform-as-a-Service Force.com PaaS - A Cloud Computing Architecture for the Enterprise Force.com Platform and the AppExchange.

### **Force.Com Cloud Platform**

The Force.com cloud platform makes building applications faster and easier than ever. It includes a database, security, workflow, user interface, and other tools that step you through the process of building powerful business applications, Web sites, and mobile applications.

## **2.5 SECURITY ISSUES IN CLOUD COMPUTING**

### **Platform Security**

Each of Fractal's technical threads presents its own security challenges. For example, the cloud-scale repository Poses problems inherent to multi-tenanted content management, including isolation, sandboxing, scaling, and usage

- Tracking Allowing users access to programmable behaviors introduces many security issues, especially guaranteeing
- Safe execution The service runtime must ensure that the intellectual property embodied within both services and content is protected.

## **2.6 REQUIRED ACTIONS TO MAKE CLOUD SECURE**

Intruders would have to be restricted access to the source code, and providers often work hard to provide clean, unbreakable barriers between customers. Security can differ greatly

from application to application, from platform to platform, and from provider to provider, however.

- Authentication credential management poses another cloud security concern.
- Artificial Immune System (AIS) in danger theory is a new intelligent problem solving technique should be incorporated to increase the efficiency of cloud based application. The protected resources are defined as self, while the others (including the intrusion) are defined as nonself. The central idea of the Danger Theory is that the immune system does not respond to nonself but to danger. This is used as a tool to define danger signals on continuously changing parameters.

Yet on the whole, the cloud holds must promise for guarantee security over application.

## CHAPTER 3

### FUTURE ENHANCEMENTS

#### 3.1 SCOPE AND FUTURE TRENDS

The world of computing is moving away from the on premises IT model, where you keep buying servers, PCs and software licenses as your business grows. Cloud computing disrupts the conventional model and opens a new IT path for the small-to mid size business: “clouds” of computing power, accessed over the Internet, become your server and your data center. Among the clouds: inexpensive applications that users can access on demand from any location and through a variety of devices.

Cloud computing—or SaaS, if you prefer—frees up budget for companies handcuffed by IT expenses. Instead of purchasing additional software licenses and hardware for new employees and new locations, businesses can simply open new employee accounts with providers of their cloud based services to expand computing capacity

With the workload factoring technology in cloud computing, the hybrid cloud computing model allows enterprise IT systems to adopt a hybrid cloud computing model where a dedicated resource platform runs for hosting application base loads, and a separate and shared resource platform serves trespassing peak load. Given the elastic nature of the cloud infrastructure, it creates a situation where cloud resources are used as an extension of existing infrastructure.

It’s not an all or nothing decision; companies can ease into the cloud without abandoning established infrastructure and applications. For the future work, extending the hybrid cloud computing model scope to stateful applications such as n-tier web services is a natural and challenging step. Many new problems arise such as session maintenance, service time estimation, and data consistency. We are working on a fast data on demand service and integrating the dynamic web service scaling approach proposed in into our mechanism.

According to a survey by Gartner, "Nearly 90 percent of organizations surveyed expect to maintain or grow their usage of software as a service (SaaS), citing cost-effectiveness and ease/speed of deployment as primary reasons for adoption."

- "By 2011, early technology adopters will forgo capital expenditures and instead purchase 40 percent of their IT infrastructure as a service," states Gartner Group.
- "Increased high-speed bandwidth makes it practical to locate infrastructure at other sites and still receive the same response times."
- 69 percent of America Internet users are using some form of Internet-based computing, such as web-based e-mail or photo storage, according to a study by Pew Research Center.
- By 2013, 12 percent of world software market will be Internet based forms of SaaS and cloud computing, according to Merrill Lynch.

### **What impact will a long-term, global recession have on cloud computing?**

A survey by ScanSafe, a SaaS provider of security services, revealed that 78% of IT managers believe economic uncertainty makes SaaS more appealing.

## **3.2 CLOUD SCALE REPOSITORY DESIGN**

Content spaces require a core repository architecture that takes advantage of cloud implementation while giving "owners" sufficient control over and access to "their" content. Operational characteristics that distinguish Fractal from current repositories include the ability to scale out for very large numbers of tenants and up for tenants with large numbers of objects; to distribute data across multiple storage nodes; to tolerate node failures (i.e. self healing); and to provide differentiated levels of service on a per-tenant basis and track resource usage (storage, bandwidth).

- At cloud scale, a repository needs to support thousands of content spaces and millions of documents, concurrently
- Accessed by tens of thousands of users. Supporting the sophisticated policy-based automation required for content

- Spaces over such large volumes of data and requests is challenging.

### **3.3 PROBLEMS RELATED WITH CLOUD COMPUTING**

The related problems inherent in multi-tenanted content management, including isolation, sandboxing, scaling, and usage tracking, which will continue to be an on-going problem for cloud infrastructure service providers.

In a cloud-based software environment, physical security is stronger because the loss of a client system does not compromise data or software. However, how secure is the service provider's system against outside attack? What do you feel about possibly having your proprietary business information in the same cloud as your competitor's? What happens if there is a system failure – is the data secure? How reliable is your service provider? These are all questions you should ask when evaluating the cloud computing alternative.

### **3.4 CONCLUSION**

Cloud computing and SaaS represent a completely different kind of client computing. The future of collaboration will focus on building and sustaining communities around content, and we envision scalable cloud-hosted objects called content spaces that will support ecosystems of users and developers growing around content and content-related tasks and ideas. Content spaces will enable seamless collaboration around items of content, in a manner far beyond the capabilities of today's tools. A new generation of platform, optimized for the creation and composition of cloud-based services to deliver content spaces to a wide range of users across many domains, will give users, developers and service providers the freedom to build content- and user-centered solutions driven by individual requirements and preferences.

Critically, future applications based on content spaces will be aggregations of behaviors that are bound to and augment content, rather than content being the by-product of applications.
